

**MANAGEMENT SUPPORT**

**Energy Management, Education and Conservation**

The Pullman School District board of directors recognizes the responsibility to develop and maintain programs and sustainability practices that support the conservation of energy and natural resources. In recognition of this leadership responsibility, the district will strive to (a) institute effective energy management, (b) provide information and develop conservation attitudes and skills for the students it serves, (c) develop and implement sustainability activities/goals, (d) plan educational activities that promote conservation of energy and other natural resources, and (e) teach Washington State Sustainability Standards. To achieve the objectives of energy management, the board will appoint a team representing the board, administration, staff, students, parents and utility representatives to develop and review plans for efficient energy management in the daily operation of the district's facilities. The Sustainability Committee will have the responsibility to:

- A. Assess past and present energy consumption practices;
- B. Review current operational and maintenance practices;
- C. Study operation changes designed to reduce consumption and related costs;
- D. Examine the feasibility of retrofitting alternatives for existing facilities as a result of engineering studies and reports;
- E. Provide periodic reports and/or recommendations to the superintendent and board;
- F. Monitor the energy management measures which are implemented;
- G. Ensure, through a monitoring process, that instruction in energy use and conservation is incorporated into the district's program.

The board, as part of its educational mission, desires to foster the conservation ethic among students. To achieve the objectives of the energy education program, instructional activities will be designed to inform students' perceptions of the supply and costs of natural resources which, in turn, will stimulate skill-building to effect responsible conservation behavior. As part of the educational process, students will be encouraged to assess the energy consumption policies of the school as a means of applying knowledge and skill. A successful sustainability program consisting of effective energy management, conservation activities, and educating students, staff, and community members regarding Washington State Sustainability Standards relies upon active participation by the school district, and partnerships with community members and organizations.

The superintendent or designee is authorized to establish annual sustainability goals, annual energy education goals, extrinsic rewards to school buildings in recognition of conservation accomplishments, and conservation measures in collaboration with the district Sustainability Committee. The superintendent will provide periodic and annual evaluation reports to the board.

**Energy Conservation**

In light of the increasing cost and dwindling supply of conventional energy sources, a life cycle cost analysis will be required of each major construction project. A life cycle cost analysis will include a description of:

- A. Insulation and heat retention factors;
- B. Variable occupancy and operating conditions to be incurred by the facility;
- C. Overall supply and demand of the facility's energy system and actual or potential utilization of outside energy sources, such as climate;
- D. Initial cost of energy plant; and
- E. An energy consumption analysis comparing alternative energy systems.

As part of its commitment to energy conservation, the district will consider the use of at least one renewable energy system such as solar energy, wind or wood or wood waste, geothermal, or other nonconventional fuels in any construction or renovation project.
